The child's center, with and without retained feedback

Measured network scans · same physical span and gray scale · no fitted crossing overlaid

Left center: α = 0.07309363265, $\log_{10}T$ = -0.15440238178; β = 0.

Right center: α = 0.07331776449, $\log_{10}T$ = -0.15804614858; β = 0.0064485310.

Each panel: 128 × 128 fixed-start cells; 300 settling + 300 measurement steps; nearest-cell rendering.

Darker gray means stronger contraction. Trace reconnection has separate orbit evidence; these ridges need not connect.

Purple–yellow, if present: exponent >0.001 with no detected recurrence ≤32. No exact superstability is inferred.
